

e-FileWatcher

- e-FileWatcher for modelling flexible workflows
- Central monitoring of directories, e-mail mailboxes, and print data flows
- Straightforward creation of workflows via configuration interface
- Configuration of any combination of rule-based processes
- Flexible application for realisation of specific customer requirements and processes

Flexible digital workflows and processes

e-FileWatcher is a powerful workflow engine with multiple capture inputs available; such as folder monitoring, e-mail mailboxes, print data streams and SQL databases. Once the data or documents have been captured the rules-based workflow engine can be used to define processes which can convert, merge, Redact, lookup external data and more. Documents or data can then be saved or exported to multiple options like printers, MS OneDrive, network folders and e-mail.

Quick and easy workflow modelling

Document conversion

Document conversion is all about converting your files from one format to another. This helps your organisation transfer data and information seamlessly from one workflow or process to another.

Convert documents from an existing folder, email address or MFP and convert these via OCR to Word, Excel or text searchable PDF/A (as well as many others).

Route converted documents to email addresses (as a hyperlink or as an attachment), network folder, to FTP or to a range of document management systems including SharePoint.

Do you have a unique document converting and routing requirement?

e-FileWatcher supports the creation of custom scripts which allows your organisation to create your own bespoke conversion solutions.

Flexibility and combination options for workflows

Add customised information such as a time stamp or water mark to your scanned document

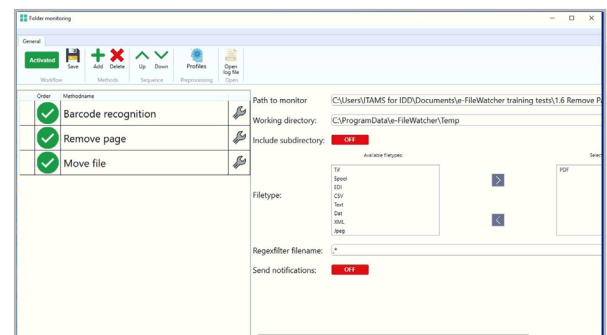

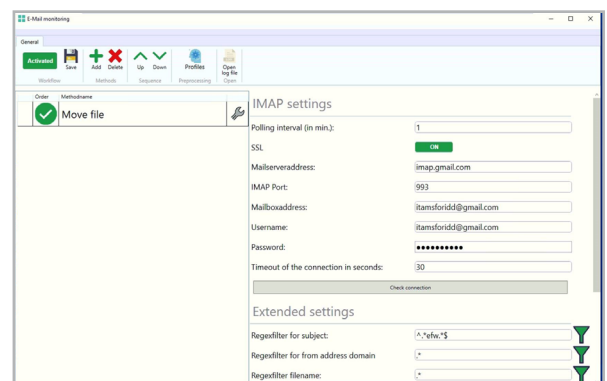

Automatically save the document to a defined network folder or print e-mail attachments as soon as they are received. The options for process modelling are varied and linkable.

Easy administration

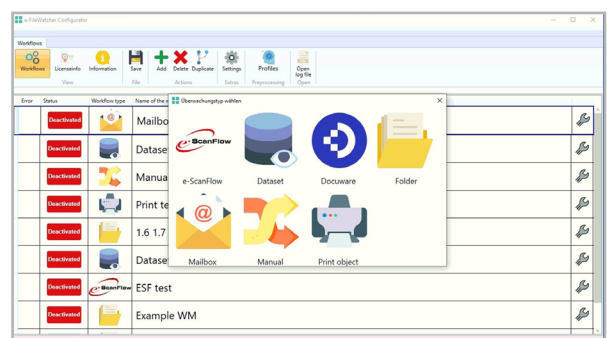

A configurator is provided to allow you to create workflows and their links, giving you a quick overview of your defined processes at any time.

Alert management

Automatic email alerts can be set to send to anyone and are triggered by device notifications, threshold settings or scheduled device reporting. For example, you can set threshold settings for consumables to alert designated email recipients that consumables are running low, to take proactive measures to reduce any downtime.

Folder Monitoring

Configuration

Key Features

The e-FileWatcher application is modular so that it can be adapted as and when required.
